- **Interpretability**

Algorithmic rankers

<https://freedom-to-tinker.com/2016/08/05/revealing-algorithmic-rankers/>

Input: database of items (individuals, colleges, cars, ...)

Score-based ranker: computes the score of each item using a known formula, e.g., monotone aggregation, then sorts items on score

Output: permutation of the items (complete or top-k)

Do we have transparency?

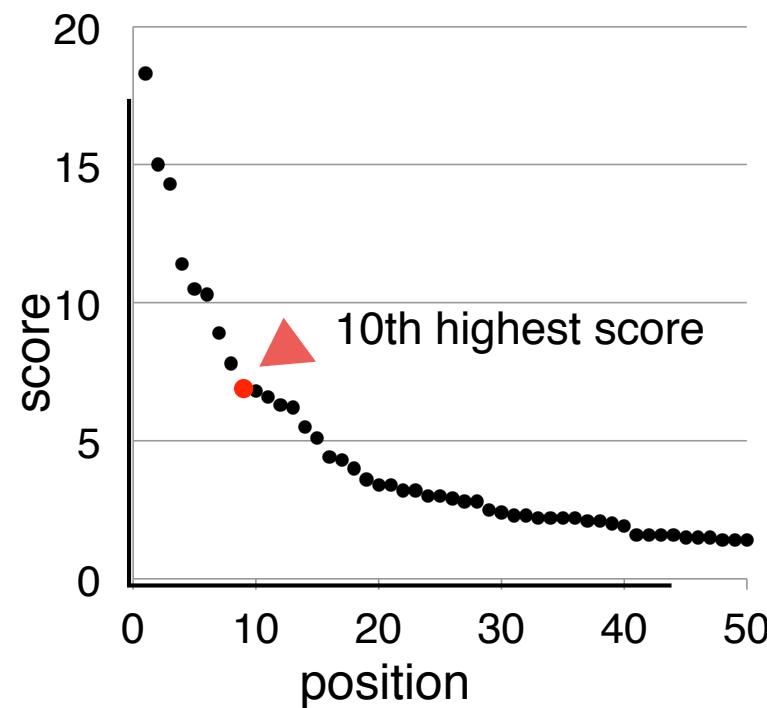

We have syntactic transparency, but lack interpretability!

Opacity in algorithmic rankers

<https://freedom-to-tinker.com/2016/08/05/revealing-algorithmic-rankers/>

Reason 1: The scoring formula alone does not indicate the relative rank of an item.

Scores are absolute, rankings are relative. Is 5 a good score? What about 10? 15?

Opacity in algorithmic rankers

<https://freedom-to-tinker.com/2016/08/05/revealing-algorithmic-rankers/>

Reason 2: A ranking may be unstable if there are tied or nearly-tied items.

Rank	Institution	Average Count	Faculty
1	► Carnegie Mellon University	18.4	123
2	► Massachusetts Institute of Technology	15.6	64
3	► Stanford University	14.8	56
4	► University of California - Berkeley	11.5	50
5	► University of Illinois at Urbana-Champaign	10.6	56
6	► University of Washington	10.3	50
7	► Georgia Institute of Technology	8.9	81
8	► University of California - San Diego	8	51
9	► Cornell University	7	45
10	► University of Michigan	6.8	63
11	► University of Texas - Austin	6.6	43
12	► University of Massachusetts - Amherst	6.4	47

Opacity in algorithmic rankers

<https://freedom-to-tinker.com/2016/08/05/revealing-algorithmic-rankers/>

Reason 3: A ranking methodology may be unstable:
small changes in weights can trigger significant re-shuffling.

Opacity in algorithmic rankers

<https://freedom-to-tinker.com/2016/08/05/revealing-algorithmic-rankers/>

Reason 4: The weight of an attribute in the scoring formula does not determine its impact on the outcome.

Rank	Name	Avg Count	Faculty	Pubs	GRE
1	CMU	18.3	122	2	791
2	MIT	15	64	3	772
3	Stanford	14.3	55	5	800
4	UC Berkeley	11.4	50	3	789
5	UIUC	10.5	55	3	772
6	UW	10.3	50	2	796
39	U Chicago	2 ••••	28	2	779
40	UC Irvine	1.9	28	2	787
41	BU	1.6	15	2	783
41	U Colorado Boulder	1.6	32	1	761
41	UNC Chapel Hill	1.6	22	2	794
41	Dartmouth	1.6	18	2	794

Given a score function:
 $0.2 * faculty +$
 $0.3 * avg\ cnt +$
 $0.5 * gre$

Rankings are not benign!

THE NEW YORKER

DEPT. OF EDUCATION FEBRUARY 14 & 21, 2011 ISSUE

THE ORDER OF THINGS

What college rankings really tell us.

By Malcolm Gladwell

Rankings are not benign. They enshrine very particular ideologies, and, at a time when American higher education is facing a crisis of accessibility and affordability, we have adopted **a de-facto standard of college quality** that is uninterested in both of those factors. And why? Because a group of magazine analysts in an office building in Washington, D.C., decided twenty years ago to **value selectivity over efficacy**, to **use proxies** that scarcely relate to what they're meant to be proxies for, and to **pretend that they can compare** a large, diverse, low-cost land-grant university in rural Pennsylvania with a small, expensive, private Jewish university on two campuses in Manhattan.

Harms of opacity

<https://freedom-to-tinker.com/2016/08/05/revealing-algorithmic-rankers/>

1. **Due process / fairness.** The subjects of the ranking cannot have confidence that their ranking is meaningful or correct, or that they have been treated like similarly situated subjects - **procedural regularity**
2. **Hidden normative commitments.** What factors does the vendor encode in the scoring ranking process? What are the **actual** effects of the scoring / ranking process? Is it stable? How was it validated?

Harms of opacity

<https://freedom-to-tinker.com/2016/08/05/revealing-algorithmic-rankers/>

3. **Interpretability.** Especially where ranking algorithms are performing a public function, **political legitimacy** requires that the public be able to interpret algorithmic outcomes in a meaningful way. Avoid *algocracy*: the rule by incontestable algorithms.

4. **Meta-methodological assessment.** Is a ranking / *this* ranking appropriate here? Can we use a process if it cannot be explained? Probably yes, for recommending movies. Probably not for college admissions.

an (ongoing) attempt
at regulation

The original draft

Int. No. 1696

August 16, 2017

By Council Member Vacca

A Local Law to amend the administrative code of the city of New York, in relation to automated processing of **data** for the purposes of targeting services, penalties, or policing to persons

Be it enacted by the Council as follows:

- 1 Section 1. Section 23-502 of the administrative code of the city of New York is amended
- 2 to add a new subdivision g to read as follows:
 - 3 g. Each agency that uses, for the purposes of targeting services to persons, imposing
 - 4 penalties upon persons or policing, an algorithm or any other method of automated processing
 - 5 system of **data** shall:
 - 6 1. Publish on such agency's website, the source code of such system; and
 - 7 2. Permit a user to (i) submit **data** into such system for self-testing and (ii) receive the
 - 8 results of having such **data** processed by such system.
- 9 § 2. This local law takes effect 120 days after it becomes law.

Summary of Local Law 49

January 11, 2018

An **Automated Decision System (ADS)** is a “computerized implementation of algorithms, including those derived from machine learning or other data processing or artificial intelligence techniques, which are used to make or assist in making decisions.”

Form task force that surveys the current use of ADS in City agencies and develops procedures for:

- requesting and receiving an **explanation** of an algorithmic decision affecting an individual (3(b))
- interrogating ADS for **bias and discrimination** against members of legally-protected groups (3(c) and 3(d))
- allowing the **public** to **assess** how ADS function and are used (3(e)), and archiving ADS together with the data they use (3(f))

The ADS Task Force

Mayor de Blasio Announces First-In-Nation Task Force To Examine Automated Decision Systems Used By The City

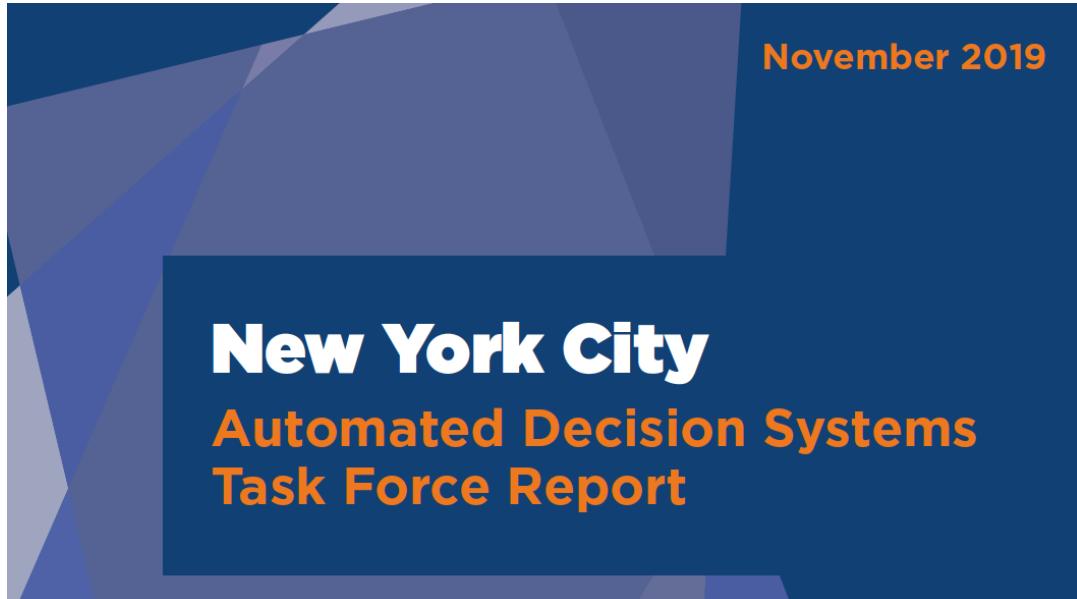

May 16, 2018

NEW YORK— Today, Mayor de Blasio announced the creation of the Automated Decision Systems Task Force which will explore how New York City uses algorithms. The task force, the first of its kind in the U.S., will work to develop a process for reviewing “automated decision systems,” commonly known as algorithms, through the lens of equity, fairness and accountability.

“As data and technology become more central to the work of city government, the algorithms we use to aid decision making must be aligned with our goals and values,” said **Mayor de Blasio**. “The establishment of the Automated Decision Systems Task Force is an important first step towards greater transparency and equity in our use of technology.”

The outcome (so far)

November 19, 2019

THE CITY OF NEW YORK

<https://www1.nyc.gov/assets/adstaskforce/downloads/pdf/ADS-Report-11192019.pdf>

<https://www1.nyc.gov/assets/home/downloads/pdf/executive-orders/2019/eo-50.pdf>

from transparency to
interpretability

Point 1

algorithmic transparency is not synonymous with releasing the source code

publishing source code helps, but it is sometimes unnecessary and often insufficient

Point 2

algorithmic transparency requires data transparency

data is used in training, validation, deployment

validity, accuracy, applicability can only be understood in the data context

data transparency is necessary for all ADS, not only for ML-based systems

Point 3

**data transparency is not synonymous
with making all data public**

release data whenever possible;

also release:

data selection, collection and pre-processing methodologies; data provenance and quality information; known sources of bias; privacy-preserving statistical summaries of the data

Attribute	Weight
PubCount	1.0
Faculty	1.0
GRE	1.0

Ingredients

Attribute	Correlation
PubCount	1.0
CSRankingAllArea	0.24
Faculty	0.12

Correlation strength is based on its absolute value. Correlation over 0.75 is high, between 0.25 and 0.75 is medium, under 0.25 is low.

← Ingredients

Top 10:			
Attribute	Maximum	Median	Minimum
PubCount	18.3	9.6	6.2
CSRankingAllArea	13	6.5	1
Faculty	122	52.5	45

Overall:			
Attribute	Maximum	Median	Minimum
PubCount	18.3	2.9	1.4
CSRankingAllArea	48	26.0	1
Faculty	122	32.0	14

Stability

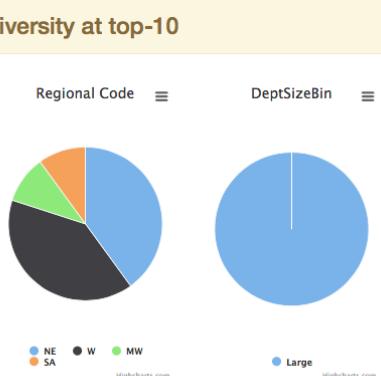

Stability ranked on generated scores (top 100)

Slope at top-10: -6.91. Slope overall: -1.61.
Unstable when absolute value of slope of fit line in scatter plot <= 0.25 (slope threshold). Otherwise it is stable.

Diversity at top-10

Regional Code DeptSizeBin

← Stability

Top-K	Stability
Top-10	Stable
Overall	Stable

Fairness

DeptSizeBin	FA*IR	Pairwise	Proportion
Large	Fair	Fair	Fair
Small	Unfair	Unfair	Unfair

Unfair when p-value of corresponding statistical test <= 0.05.

← Fairness

DeptSizeBin	p-value	adjusted α	p-value	α	p-value	α
Large	1.0	0.87	0.99	0.05	1.0	0.05
Small	0.0	0.71	0.0	0.05	0.0	0.05

Top K = 26 in FA*IR and Proportion oracles. Setting of top K: In FA*IR and Proportion oracle, if N > 200, set top K = 100. Otherwise set top K = 50%. Pairwise oracle takes whole ranking as input. FA*IR is computed as using code in [FA*IR codes](#). Proportion is implemented as statistical test 4.1.3 in [Proportion paper](#).

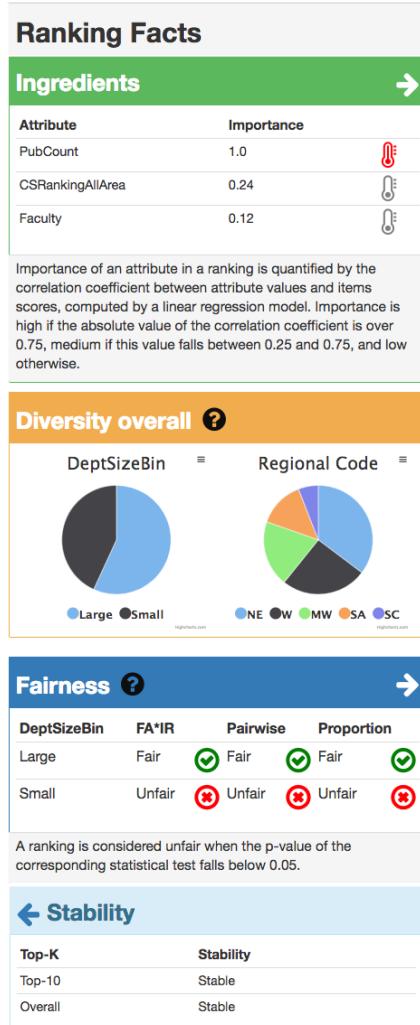

http://demo.dataresponsibly.com/rankingfacts/nutrition_facts/

Julia Stoyanovich

24

Properties of a nutritional label

comprehensible: short, simple, clear

consultative: provide actionable info

comparable: implying a standard

concrete: helps determine a dataset's fitness for use for a given task

joint with Howe [UW] - [Data Engineering Bulletin, 2019]

Point 5

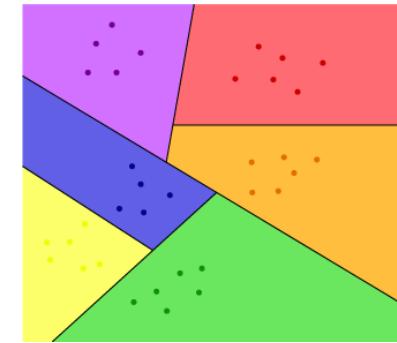

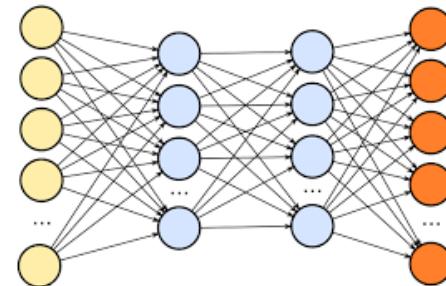

transparency by design, not as an afterthought

provision for transparency and interpretability at every stage of the data lifecycle

useful internally during development, for communication and coordination between agencies, and for accountability to the public

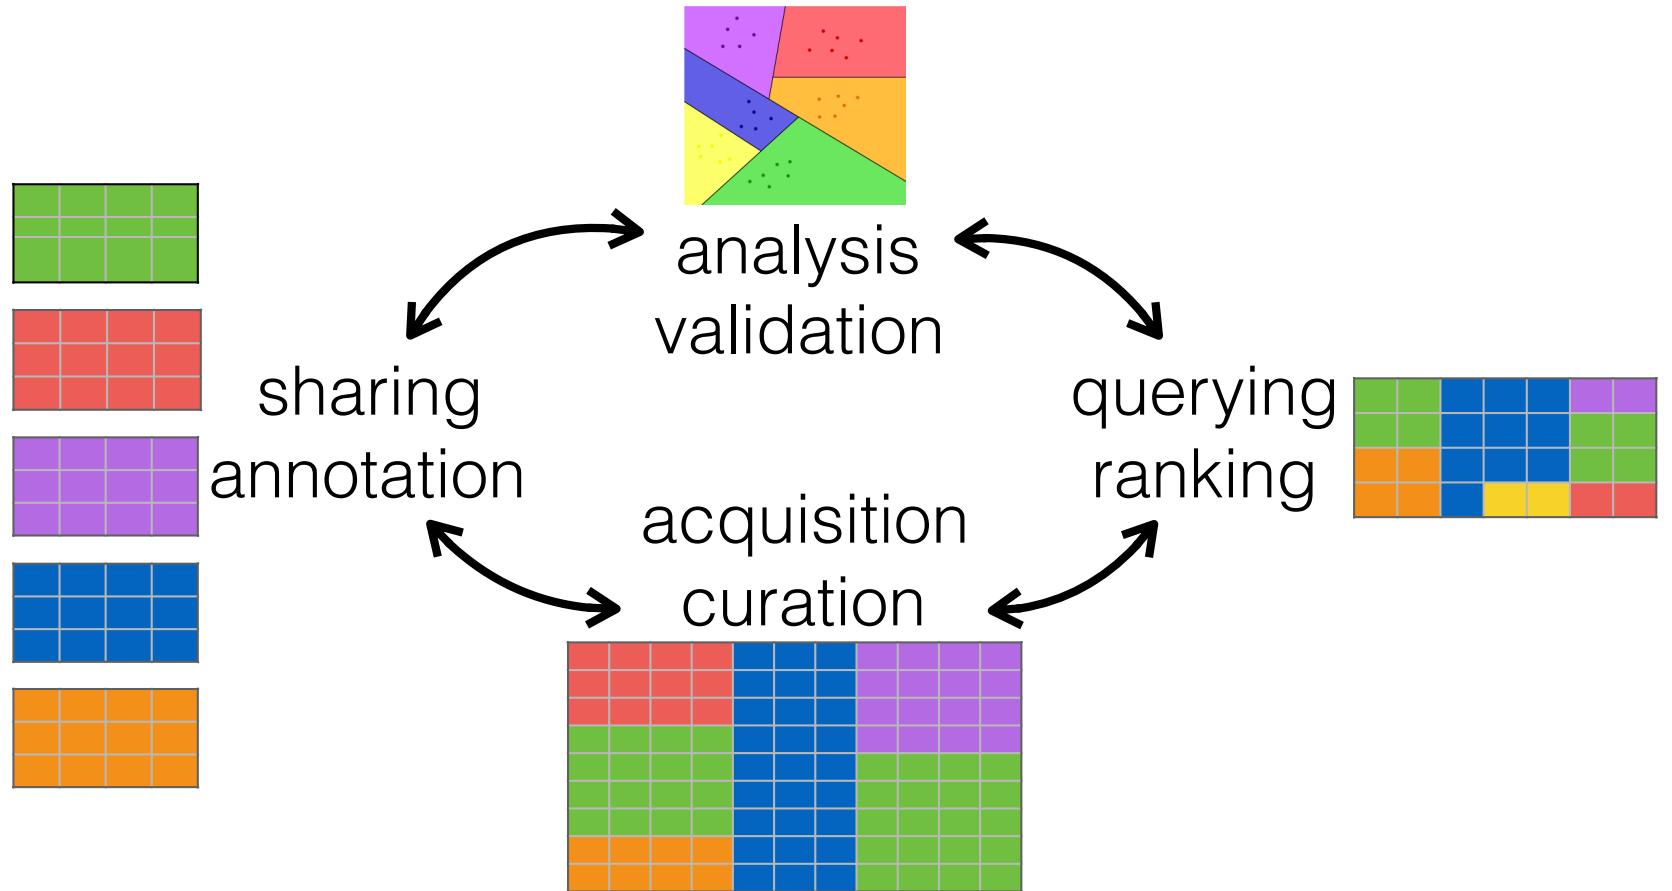

Frog's eye view

Can state all these as constraints:

for each category i , pick K_i elements, with $\text{floor}_i \leq K_i \leq \text{ceil}_i$

[J. Stoyanovich, K. Yang, HV Jagadish; *EDBT 2018*]

Hiring a job candidate

Goal: Hire a candidate with a high score

Candidates arrive one-by-one

A candidate's score is revealed when the candidate arrives

Decision to accept or reject a candidate made on the spot

The Secretary Problem

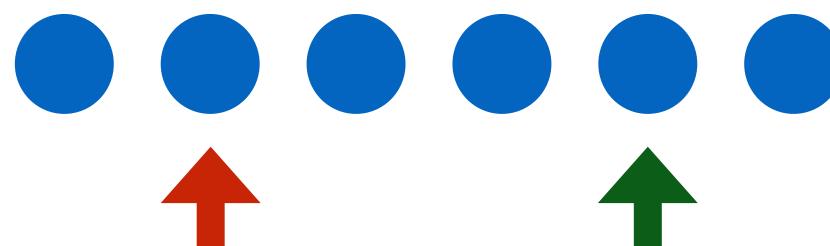

Goal: Design an algorithm for picking **one** element of a randomly ordered sequence, to maximize the probability of picking the **maximum element** of the entire sequence.

$$N = 6$$

$$S = \left\lfloor \frac{N}{e} \right\rfloor = 2$$

$$T = 4$$

4 1 3 2 5 7

Competitive ratio

$$\frac{1}{e}$$

the best possible!

Consider, and reject, the first S candidates

Record T , the best seen score among the first S candidates

Accept the next candidate with score better than T

K-choice Secretary

[Babaioff et al., 2007]

Goal: Design an algorithm for picking K elements of a randomly ordered sequence, to maximize their **expected sum**.

$$N = 6 \quad K = 2 \quad 4 \quad 1 \quad 3 \quad 2 \quad 5 \quad 7$$

$$S = \left\lfloor \frac{N}{e} \right\rfloor = 2 \quad \bullet \quad \bullet \quad \bullet \quad \bullet \quad \bullet \quad \bullet$$

$$T = \{1, 4\}$$

Competitive ratio

$$\frac{1}{e}$$

far from optimal

Consider, and reject, the first S candidates

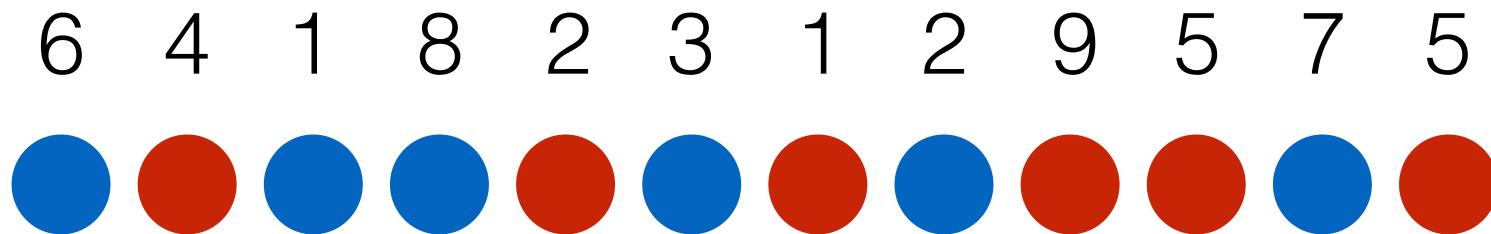

Record K best scores among the first S candidates, call this T

Whenever a candidate arrives whose score is higher than the minimum in T , accept the candidate and delete the minimum from T

Diverse K-choice Secretary

Goal: Design an algorithm for picking K elements of a randomly ordered sequence, to maximize their **expected sum**.

For each category i , pick K_i elements, with $\text{floor}_i \leq K_i \leq \text{ceil}_i$

$$N_{red} = N_{blue} = 6$$

$$K = 3$$

$$1 \leq K_{red}, K_{blue} \leq 2$$

Accept floor items for each category from per-category streams

$$\text{slack} = K - (\text{floor}_{red} + \text{floor}_{blue})$$

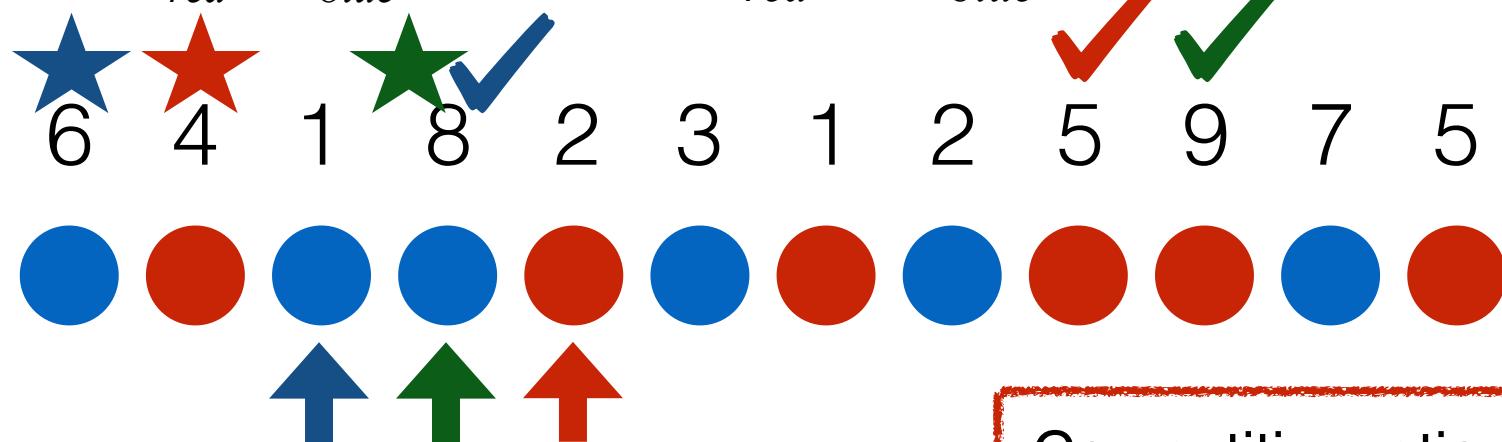

Accept the remaining slack items irrespective of category membership, but subject to ceil

[J. Stoyanovich, K. Yang, HV Jagadish; *EDBT 2018*]

Diverse K-choice Secretary

$$N_{red} = N_{blue} = 6$$

$$K = 3 \quad 1 \leq K_{red}, K_{blue} \leq 2$$

Competitive ratio

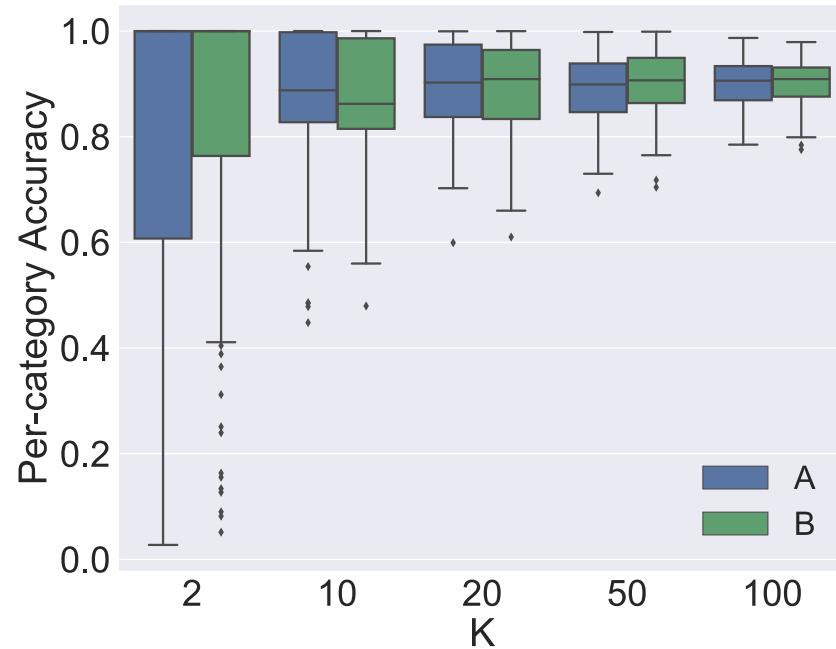

$$\frac{1}{e}$$

far from optimal

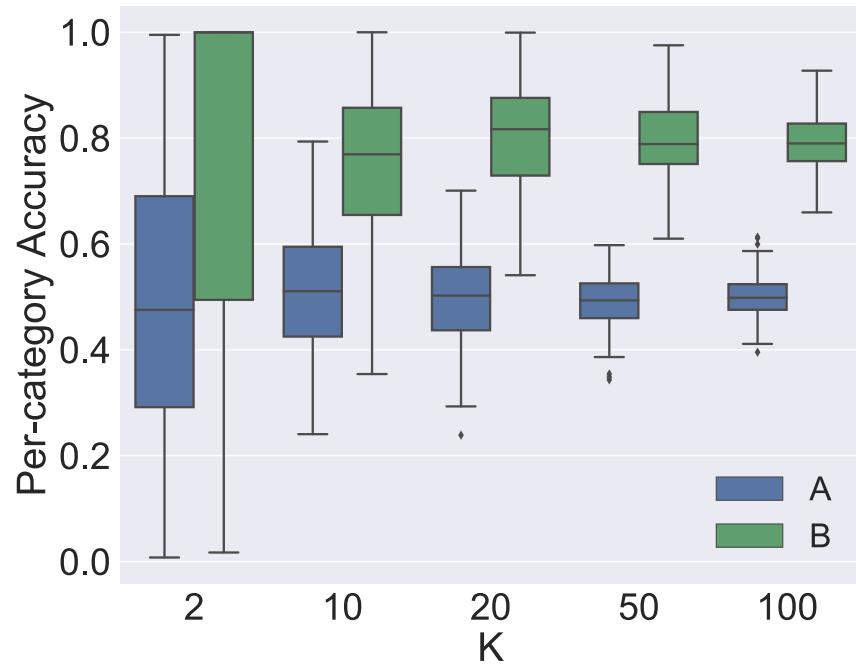

[J. Stoyanovich, K. Yang, HV Jagadish; *EDBT 2018*]

Per-category warm-up is crucial

Per-category warm-up period

Common warm-up period

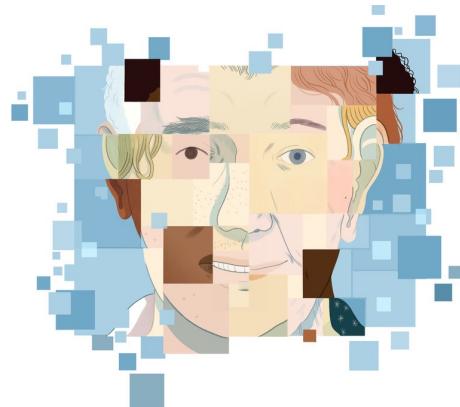

synthetic data with categories A and B, score depends on category, lower for A

diversity by design

Lack of diversity: harms and approaches

The New York Times

Artificial Intelligence's White Guy Problem

By KATE CRAWFORD JUNE 25, 2016

Like all technologies before it, artificial intelligence will reflect the values of its creators. So **inclusivity matters** — from who designs it to who sits on the company boards and which ethical perspectives are included.

Otherwise, **we risk constructing machine intelligence that mirrors a narrow and privileged vision of society**, with its old, familiar biases and stereotypes.

Abstract

Big data technology offers unprecedented opportunities to society as a whole and also to its individual members. At the same time, this technology poses significant risks to those it overlooks. In this article, we give an overview of recent technical work on diversity, particularly in selection tasks, discuss connections between diversity and fairness, and identify promising directions for future work that will position diversity as an important component of a data-responsible society. We argue that diversity should come to the forefront of our discourse, for reasons that are both ethical—to mitigate the risks of exclusion—and utilitarian, to enable more powerful, accurate, and engaging data analysis and use.

Keywords: data; diversity; empirical studies; models and algorithms; responsibly

Score-based rankers

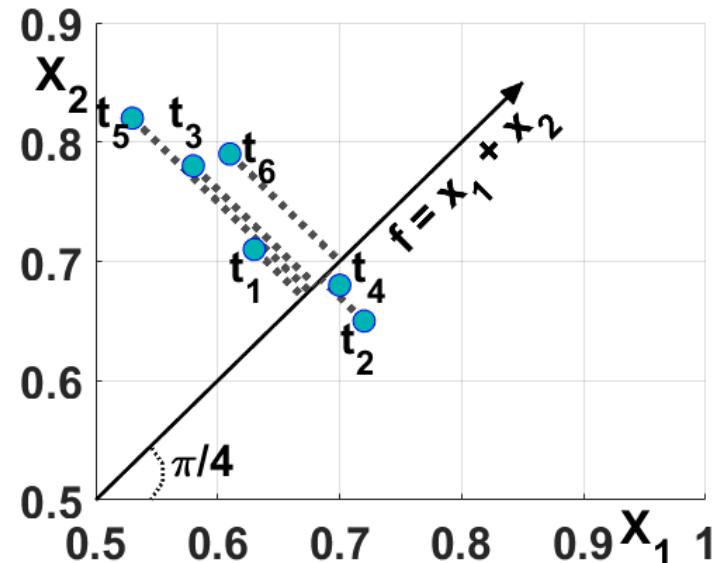

- tuple x in D ; $\text{score}(x)$: sum of attribute values, with non-negative weights (a common special case of **monotone aggregation**)
- weights **subjectively chosen by a user**: $0.5g + 0.5s$, where g - normalized GPA, s - normalized SAT; why not $0.45g + 0.55s$?

\mathcal{D}			f
id	x_1	x_2	$x_1 + x_2$
t_1	0.63	0.71	1.34
t_2	0.72	0.65	1.37
t_3	0.58	0.78	1.36
t_4	0.7	0.68	1.38
t_5	0.53	0.82	1.35
t_6	0.61	0.79	1.4

[A. Asudeh, HV Jagadish, G. Miklau, J. Stoyanovich; VLDB 2019]

Geometry of a (2D) ranker

\mathcal{D}			f
id	x_1	x_2	$x_1 + x_2$
t_1	0.63	0.71	1.34
t_2	0.72	0.65	1.37
t_3	0.58	0.78	1.36
t_4	0.7	0.68	1.38
t_5	0.53	0.82	1.35
t_6	0.61	0.79	1.4

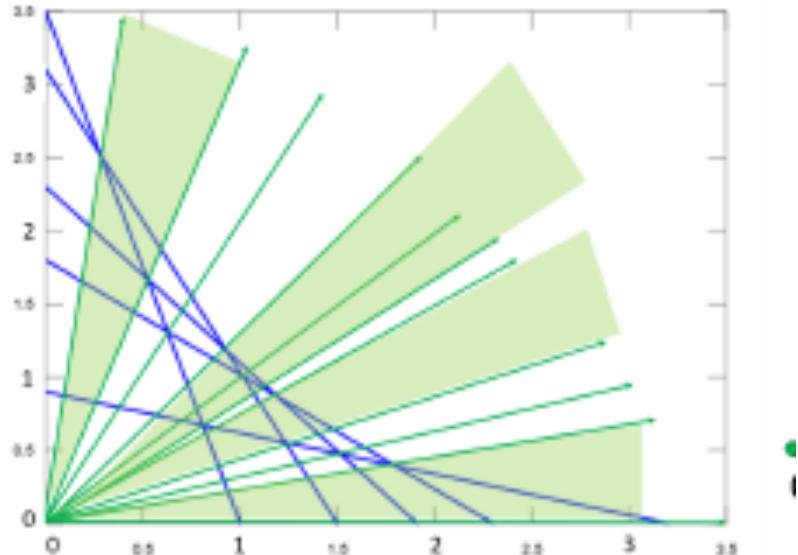

- tuples are points in 2D, scoring functions are rays starting from the origin
- to determine a ranking of the points, we read it off from the projections of the points onto the ray of the scoring function, walking the ray towards the origin
- examples: $f(x) = x_1 + x_2$ $f(x) = x_1$ $f(x) = x_2$

[A. Asudeh, HV Jagadish, G. Miklau, J. Stoyanovich; VLDB 2019]

Stability of a ranking

DEFINITION 2 (STABILITY OF \mathbf{r} AT \mathcal{D}). *Given a ranking $\mathbf{r} \in \mathfrak{R}_{\mathcal{D}}$, the stability of \mathbf{r} is the proportion of ranking functions in \mathcal{U} that generate \mathbf{r} . That is, stability is the ratio of the volume of the ranking region of \mathbf{r} to the volume of \mathcal{U} . Formally:*

$$S_{\mathcal{D}}(\mathbf{r}) = \frac{\text{vol}(R_{\mathcal{D}}(\mathbf{r}))}{\text{vol}(\mathcal{U})}$$

most important finding:
FIFA rankings, used for seeding tournaments, are unstable! More in the paper.

[A. Asudeh, HV Jagadish, G. Miklau, J. Stoyanovich; VLDB 2019]

Ordering exchange

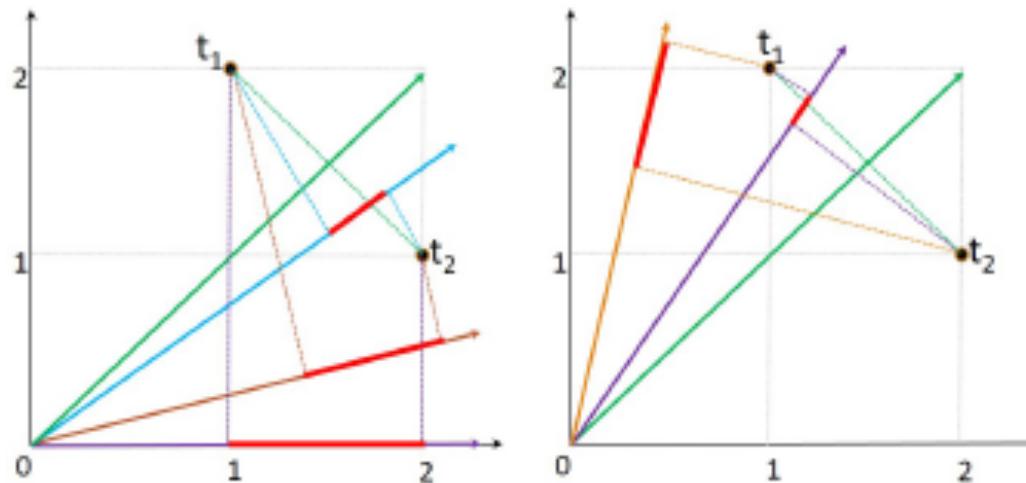

Key idea: only look at scoring functions that change the relative order between some pair of points. These are the only points where the oracle may change its mind!

$$t_1 \langle 1,2 \rangle \quad t_2 \langle 2,1 \rangle$$

$$t_2 \succ_x t_1$$

$$t_2 =_{x+y} t_1$$

$$t_2 \prec_y t_1$$

An **ordering exchange** is a set of functions that score a pair of points equally. In 2D, it corresponds to a single function.

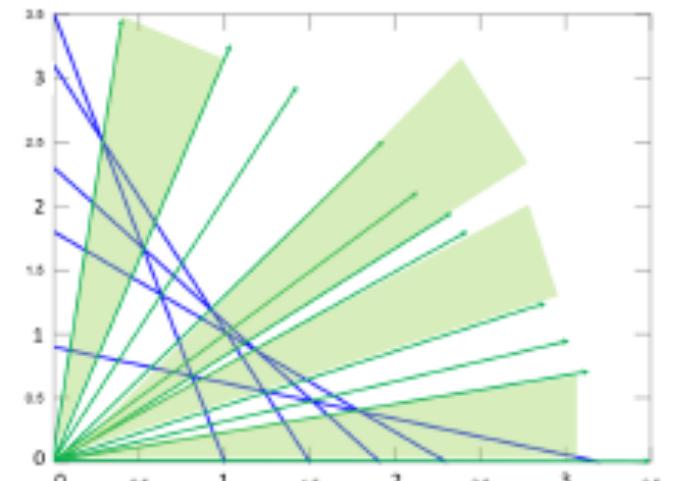

[A. Asudeh, HV Jagadish, G. Miklau, J. Stoyanovich; VLDB 2019]

Working with the geometry

Step 1: pre-compute an index over the space

Step 2: efficiently answer questions at query time

- Give a list of stable regions
- Give stable regions closest to my scoring function
- Interrogate stability or fairness of a scoring function
- (Similar methods to compute fair or diverse regions)

[A. Asudeh, HV Jagadish, G. Miklau, J. Stoyanovich; VLDB 2019]

Italian seismologists cleared of manslaughter

Appeals court says six scientists did not cause deaths in 2009 L'Aquila earthquake and cuts sentence of a government official.

Alison Abbott & Nicola Nosengo

10 November 2014

Six seismologists accused of misleading the public about the risk of an earthquake in Italy were cleared of manslaughter on 10 November. An appeals court overturned their six-year prison sentences and reduced to two years the sentence for a government official who had been convicted with them.

The magnitude-6.3 earthquake struck the historic town of L'Aquila in the early hours of 6 April 2009, killing more than 300 people.

Personal responsibility?

NATURE | NEWS

Italian seismologists cleared of manslaughter

Appeals court says six scientists did not cause deaths in 2009 L'Aquila earthquake and cuts sentence of a government official.

Alison Abbott & Nicola Nosengo

10 November 2014

The finding by a three-judge appeals court prompted many L'Aquila citizens who were waiting outside the courtroom to react with rage, shouting “shame” and saying that the Italian state had just acquitted itself, local media reported. But it **comes as a relief to scientists around the world who had been following the unprecedented case with alarm.**

“We don’t want to have to be worried about the possibility of being prosecuted if we give advice on earthquakes,” says seismologist Ian Main of the University of Edinburgh, UK. “That would discourage giving honest opinion.”
